1 Google SWE points 48 AI agents at NASA Lidar, finds unmapped Maya pyramid in 72h

In a stunning display of multi-agent orchestration, a software engineer unleashed 48 independent AI agents onto raw NASA Lidar geographic scanning data. Working collaboratively over a 72-hour window, the agent swarm cross-referenced elevation models and structural anomalies to discover a previously unmapped Maya pyramid. This feat highlights the incredible potential of scaling autonomous software agents to parse through massive, complex scientific datasets. Rather than taking months of manual archaeological surveying, the compute-driven approach instantly surfaced hidden patterns in the topography. It marks a major milestone for how artificial intelligence can accelerate real-world historical and geographical discoveries.

Why it matters:
As cloud operators and engineers, orchestrating distributed agent workloads will soon become as common as managing standard microservices. This experiment shows that throwing parallel agent compute at massive datasets yields exponential time savings.

2 Atuin Threads: All your agent sessions on every machine

As developers increasingly rely on AI coding assistants and terminal agents across multiple workstations, keeping track of context has become a logistical nightmare. Atuin has introduced 'Threads', a new feature built to synchronize all your active agent sessions across every machine you use. The system securely captures and links your terminal history and agent states so you can pick up a complex coding task instantly, regardless of whether you are on your desktop, laptop, or a remote server. It bridges the gap between local development environments and cloud-synced continuity, ensuring developer context is never lost in transit.

Why it matters:
Developer productivity tools are evolving past simple dotfile syncing into state-aware agent session managers. For engineers working across mixed environments, unified session history is a massive quality-of-life win.

3 ChatGPT is getting verified AI ‘Business Agents’

OpenAI is expanding ChatGPT's capabilities by introducing verified 'Business Agents' designed to officially represent brands within the chat interface. Initially rolling out to eligible e-commerce and online platforms, these agents can directly interact with users to assist with product comparisons, customer queries, and transactional support. Because the businesses are officially verified, consumers can trust that the data and recommendations coming from the agent are legitimate and direct from the source. This transformation turns conversational AI into a direct gateway for online retail and enterprise customer service.

Why it matters:
The monetization and utility of LLMs are pivoting toward agentic commerce where software acts as the

primary intermediary between buyers and brands. Developers should prepare for API integrations that support verified, transactional agent endpoints.
